

Fix: Booking copy points to a missing Instagram

Type: Fix

Status: verified

Branch: `fix/booking-copy-points-to-a-missing-instagram`

The problem

There is no Instagram account. Frank decided on 2026-09-23 that a business account (not her personal one) waits until Dani is ready for it, so `siteConfig.social.instagram` stays `null` for the foreseeable future.

Every *link* to Instagram already hides itself when the handle is `null` - the footer, each `BookingBand`, the contact page button. The *prose* does not, and four places still send a visitor to an account that does not exist:

| Where | What it says today | Why it is wrong | |---|---|---| | Home hero, under the buttons (`home.hero.dmNote`) | "Or send a DM on Instagram, whatever is easier" | The first alternative a visitor is offered is one she cannot use | | FAQ, "How do I book?" (`faq.booking.a`) | "Send a DM on Instagram or use the form on the contact page" | Names the missing route first | | Contact page, second band (`contact.direct`) | "Would rather just message me?" then "My Instagram goes here the moment it is set up." | A heading that offers a route, over a sentence admitting there is none. The second line is placeholder text a visitor reads | | Contact form failure (`contact.failed`) | "Try again in a moment, or send me a DM instead." | Shown exactly when the form has failed, and points at the one route that also fails |

The failure message matters most. Until item 15 gives Resend a production sender, a real submission on the live site can fail, and that message is what the visitor then reads.

Both languages carry all four.

The fix

Make the prose follow the same rule the links already follow: **nothing mentions Instagram while `siteConfig.social.instagram` is `null`**. Where a string is only about Instagram, the component hides it; where a string is about booking in general, the copy changes to the route that works.

- **Hero** - render the `dmNote` line only when a handle exists. The string stays in the dictionaries for the day it does. - **Contact page** - render the whole `direct` band only when a handle exists. Its heading, body and link are all about messaging her, so there is nothing to show without one. `contact.direct.pending` is then unused; delete it from both dictionaries rather than leave a placeholder string in the repo. - **FAQ booking answer** - rewrite without Instagram: use the form on the contact page, tell her the service, roughly when suits you, and a reference photo if you have one. - **Form failure** - drop "or send me a DM instead". See the open question.

Must not break:

- **The day the account exists, one edit brings everything back.** Setting `siteConfig.social.instagram` must restore the hero line, the contact band and every link with no further code change. Only the FAQ

answer would need rewording, and the spec says so where the next editor will see it: a comment on `faq.booking`. - **The contact page's `contactPageSchema`** is unaffected; it describes the page, not the band. - **CRLF**. Dictionaries and components are CRLF in the working tree. Edit with a Node script that restores CRLF; never `sed -i`.

Build steps

- [x] **1. Hide the Instagram-only prose when there is no handle.** `components/home/Hero.tsx`: wrap the `dmNote` paragraph in the same `siteConfig.social.instagram ?` check the other links use, and update its comment. `app/[locale]/contact/page.tsx`: render the `direct <Band>` only when `instagram` is set, and drop the `pending` branch. Delete `contact.direct.pending` from `en.ts` and `es.ts`.

Done when neither `/` nor `/contact` (or their `/es` twins) contains the word "Instagram" in visible text while the handle is `null`, the build passes, and a missing key in only one dictionary would still fail it.

- [x] **2. Rewrite the two booking strings.** `faq.booking.a` and `contact.failed`, in both languages, with no mention of Instagram or DMs. Add a one-line comment above `faq.booking` saying the answer names only the form because there is no account yet, and should mention Instagram again when `siteConfig.social.instagram` is set.

Done when no page in either language mentions a DM or Instagram in its text or its `FAQPage` data, and the build passes.

- [x] **3. Correct the plan's booking assumption.** `project-plan.md` records "Instagram DM primary, form to Resend as the route for everyone else" as a `[confirm]` assumption in section 8's table. Reword that row to: contact form only until a business Instagram exists, then DMs alongside it. Then Frank runs `/overview`, before `/complete`, so the overview's open question 2 and its `[confirm]` list stop describing a contradiction that no longer exists.

Done when the plan's row reads as above and the regenerated overview no longer lists the Instagram contradiction.

Verify

- `npm run lint` and `npm run build` pass. - In a browser, at `/`, `/es`, `/contact` and `/es/contact`: no visible "Instagram" or "DM"; the hero reads cleanly without the line under its buttons; the contact page ends at the form without an empty band. - The home page `FAQPage` JSON-LD has the new booking answer in both languages. - Temporarily setting a fake handle in `siteConfig` locally brings the hero line and the contact band back. Revert it before `/complete`.

Open question

1. When the form fails, there is no second way to reach her. The failure message used to offer DMs. With no Instagram, and no public email or phone on the site, it can only say "try again".

`siteConfig.business.email` is Frank's personal Gmail, which is not something to publish without asking. Options: say "try again" only (this fix's default), publish a business email once one exists, or accept it until item 15 makes the form reliable. Not blocking.

Verification performed

| Check | Result | |---|---| | `npm run lint` | exit 0 | | `npm run build` | exit 0, 19 pages, after the code steps and again at completion | | `/` and `/es` | no visible "Instagram" or "DM"; the `FAQPage` JSON-LD carries the new booking answer in both languages and mentions neither | | `/contact` and `/es/contact` | the page ends at the form; no "message me" band, no "goes here" line | | Reversibility | a fake handle set in `siteConfig` brought back the hero line and the contact band with its "Message on Instagram" link; `siteConfig.ts` restored and confirmed identical to `HEAD` | | 412px, home | the hero reads cleanly, buttons straight into the photograph | | Overview (step 3) | the Instagram contradiction is gone, the `[confirm]` list reads the new booking assumption, fingerprint matches a fresh recompute |

Departure from the spec

Step 1's done-when said `/contact` should contain no visible "Instagram". It still contains one: the option in the "How did you find me?" select. That is a source a visitor can pick, not a route the site offers her, and someone can find Dani through Instagram whether or not she has an account. It stays.

Implementation walkthrough

The rule that already existed

The site had one rule for Instagram: a *link* renders only when `siteConfig.social.instagram` is set. The footer, every `BookingBand` and the contact page button all followed it, which is why no dead link ever shipped. What did not follow it was prose. Four strings talked about DMs as if the account existed. This fix extends the same rule from links to words, rather than inventing a second mechanism.

`components/home/Hero.tsx` and `app/[locale]/contact/page.tsx`

Where a string was only about Instagram, the component now hides it. The hero's "Or send a DM on Instagram" line and the whole contact-page band ("Would rather just message me?") are gated on the handle, exactly like the links beside them.

The contact band was hidden whole, not trimmed. Its heading offers a route, its body describes the route, and its button is the route. With the button gone the first two would offer something and then fail to deliver it. The old fallback, "My Instagram goes here the moment it is set up", was placeholder text a visitor could read, and it is deleted from both dictionaries rather than left unused in the repo.

`dictionaries/en.ts` and `es.ts`

Where a string was about booking in general, the words changed. The FAQ's "How do I book?" now names only the form, with a comment saying to mention DMs again once the account exists; that is the one string the future account does not restore by itself. The form's failure message lost "or send me a DM instead", and its comment now says why there is no second route to name.

The failure message was the one that mattered most. It shows exactly when the form has failed, and until item 15 gives Resend a production sender a real submission on the live site can fail. It was pointing a stuck visitor at the one other route that also did not exist.

`blueprint/project-plan.md`

Section 8's `[confirm]` table had assumed "Instagram DM primary". Frank's 2026-09-23 decision made that false, so the row now reads contact form only until a business Instagram exists. The overview was

regenerated from it before completion; `/complete` was first run without that step, stopped at the safety pass, and resumed after `/overview` .

How reversibility was proved

Not argued, demonstrated: a fake handle was written into `siteConfig` , both hidden pieces came back in the browser with no other change, and the file was restored from a copy and diffed against `HEAD` before anything was committed.

Found, not fixed

- **Every page ships its locale's entire dictionary to the browser.** The header passes the full dictionary to the client-side language switch, so the React payload on every page carries every string on the site, gallery alt text included. It predates this fix and deserves its own. - **One 500 on the first request after the dev server started**, a JSON parse error on `/en` , with every later request returning 200 and the production build clean. Most likely two dev servers sharing `.next` , since port 3000 was still held by an earlier one.

Still open

When the form fails there is no second way to reach her. It closes with a business email, an Instagram account, or item 15. It is recorded as open question 9 in the overview.
